rape

SF Greenland

The new benchmark for forage rape

Australian release: 2006

SF Greenland is a very late flowering rape with traditional maturity. It is very leafy from the base of the plant and holds its quality.

Due to its late flowering, SF Greenland is well suited to sowing during from late summer until spring. It is consistently producing high yields when sown for either winter or summer feed.

Sowing rate: 3-4 kg/ha

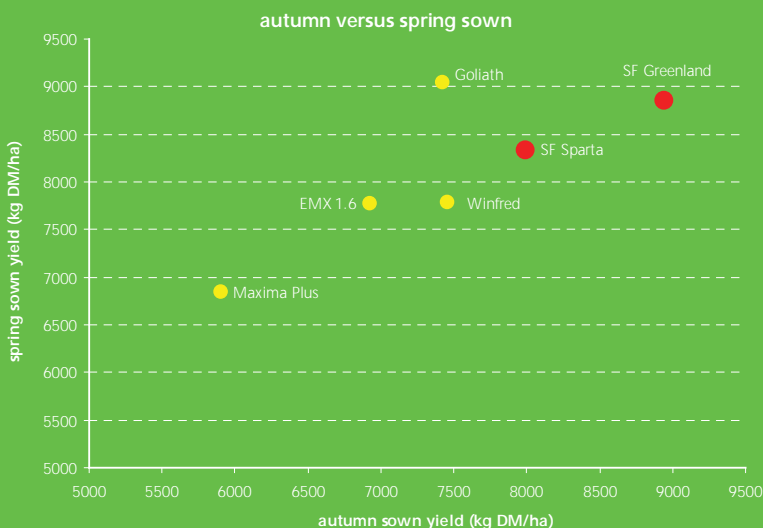

Maturity: 10-12 weeks after sowing

Relative Forage Ratings - relative to industry standards

Cultivar	sowing rate	grazings	maturity	flowering	Initial yield	regrowth	Total yield
SF Greenland	3-5kg/ha	multiple	70-90 days	Very late	109	119	110
Winfred	3-5kg/ha	multiple	70-90 days	late	100	100	100

* relative forage ratings based on data from trials sown Cressy 2003, Gundagai 2006 (3 timings) and 2007 (2 timings).

Relative performance of forage rape

The Bottom Line:

10% more feed than Winfred
